

Argumentative Essay

"Technology enhances, rather than replaces, human intelligence."

Introduction

Technology has become an important part of our daily life, from the phones we use to the apps that help us study. Some people worry that technology is making us dependent and less intelligent. However, this view is not completely true. Technology does not replace human intelligence; instead, it helps us think better, learn faster, and solve problems more effectively.

Body Paragraph 1

One major reason technology enhances human intelligence is that it gives us quick access to information. In the past, people had to spend hours searching through books. Today, with one click, we can learn new ideas and understand complex topics. For example, students use online tutorials to explain difficult subjects like math or science. This does not make them less smart—it helps them understand faster and use their time better.

Body Paragraph 2

Another way technology improves human intelligence is by helping us become more creative. Modern tools allow people to design, write, or create things they could not do before. For instance, graphic designers use digital software to bring their ideas to life, and writers use editing tools to improve their work. These tools do not create ideas on their own; they only support the creative thinking that comes from humans.

Body Paragraph 3 (Counterargument + Refutation)

Some people argue that technology makes us lazy and reduces our ability to think independently. They believe that relying on devices for answers stops us from using our own knowledge. While this concern is understandable, it is not entirely correct. Technology is only a tool; it depends on how we use it. If used wisely, technology encourages critical thinking—for example, when students research multiple sources or analyze data to understand a topic.

Conclusion

In conclusion, technology enhances human intelligence by providing information, supporting creativity, and encouraging smarter thinking. It does not replace our abilities but strengthens them. When used responsibly, technology becomes a partner in learning and problem-solving, helping us grow in ways that were not possible before.
